

a second mouse click may be recognized by the computer system 500. When the pressure 515 is applied toward the left side of the upper section (**Figure 5C**), a third mouse click may be recognized by the computer system 500. The translation logic may translate the different types of clicking motions of the upper section relative to the lower section into operations to be performed by the computer system 500. The ability to cause operations to be performed by initiating different clicking motions as described with Figures ~~5A-G~~ 5A-5C may enable a user to use the computer system 500 more efficiently.

Please replace the abstract with the following replacement abstract.

REPLACEMENT ABSTRACT

~~{0031}~~ A method for navigating information displayed on a display of a computer system includes determining movement of the computer system. The movement of the computer system is sensed by a movement sensor.
